Drilling Update

WestSide's second quarter drilling program completed and dewatering of first lateral well commenced

Highlights

- **Tilbrook:**-#8 vertical well is connected to over 2000m of exposed coal in the P seam of the Moranbah Coal Measures from two lateral wells, dewatering underway.
- **Paranui:** #10 shows 25 m of net coal with very high gas content and good gas quality to a depth of 900m

ATP 688P CSG drilling program (Tilbrook, Mount Saint Martin & Bald Hill)

WestSide has completed a five-well program in ATP 688P in the northern Bowen Basin. The program included two exploration wells (Tilbrook #8a and #8b), two core holes (Mount Saint Martin #1 and Bald Hill #1) and a horizontal chevron-style dual-lateral well (Tilbrook #L8a and #L8b) which were completed into one existing vertical well (Tilbrook #8).

Latest activity – Tilbrook #8

The Tilbrook #8 vertical well is connected to over 2000m of exposed coal in the P seam of the Moranbah Coal Measures from two lateral wells. The well has been completed and placed on production testing with dewatering of the coals now underway.

Summary : ATP 688P coal seam gas drilling program

Well	Well Type	Spud Date	Finish Date	Current Status
Tilbrook # 8a	Exploration	16 April 2009	25 April	DST completed following gas shows. P&A as planned.
Tilbrook # 8b	Exploration	26 April 2009	2 May	DST completed following gas shows. P&A as planned.
Mount Saint Martin #1	Exploration Core hole	3 May 2009	20 May	In excess of 9m of net coal measured. DST's completed. Well suspended. Analysis and desorption continues.
Bald Hill #1	Exploration Core hole	21 May 2009	3 June	In excess of 8m of net coal measured. DST's completed. Well suspended. Analysis and desorption continues.
Tilbrook #8	Lateral L8b	21 May 2009	9 June	Drilled to a depth of 1,392 m (lateral). Dewatering commenced.
	Lateral L8a	11 June 2009	27 June	Drilled to a depth of 1,393m (lateral). Dewatering commenced.

DST – Drill stem tests

P&A – Plug and Abandoned

ATP 769P CSG drilling program (Paranui)

WestSide has completed one-well program in ATP 769P in the southern Bowen Basin which builds on the current appraisal testing done to date at the Paranui CSG pilot. The current program included one exploration well (Paranui #10) which was cored to test gas content, composition and permeability of the coal seams to a depth of 900 m. The net coal is estimated at 25m. Current tests show very high gas contents and good gas quality.

Multiple cores are currently being tested by desorption of the coal cores which will determine gas saturation and composition. Drill Stem Tests (DST) to assess permeability, were suspended due to hole stability issues.

Latest activity – Paranui #10

Drilling and coring has continued through gassy coals. The well is drilling ahead at 662m.

Well	Well Type	Spud Date	Finish Date	Current Status
Paranui #10	Exploration Core hole	15 June 2009	June 29	P& A following coring and logging.

ATP 688P and ATP 769P are jointly held by WestSide (50%) and QGC (50%). Lucas Mitchell was the drilling contractor at both ATPs.

The report concludes WestSide’s regular updates for this drilling program. WestSide has initiated planning to expand the program with the intent of further increasing overall reserves.

About WestSide Corporation Ltd

WestSide Corporation Limited is listed on ASX (ASX code: WCL) and has interests in coal seam gas (CSG) projects in Queensland and Indonesia. WestSide has a 50% interest in ATP 688P and ATP 769P with QGC holding the other 50%.

WestSide is currently operating an appraisal program in ATP 769P (Paranui) and ATP 688P (Tilbrook, Mount Saint Martin and Bald Hill) sites in Queensland’s Bowen Basin, and is also assessing the CSG potential of certain coal deposits in Indonesia through its relationship with PT Bumi Resources TBK, one of Indonesia’s largest coal miners.

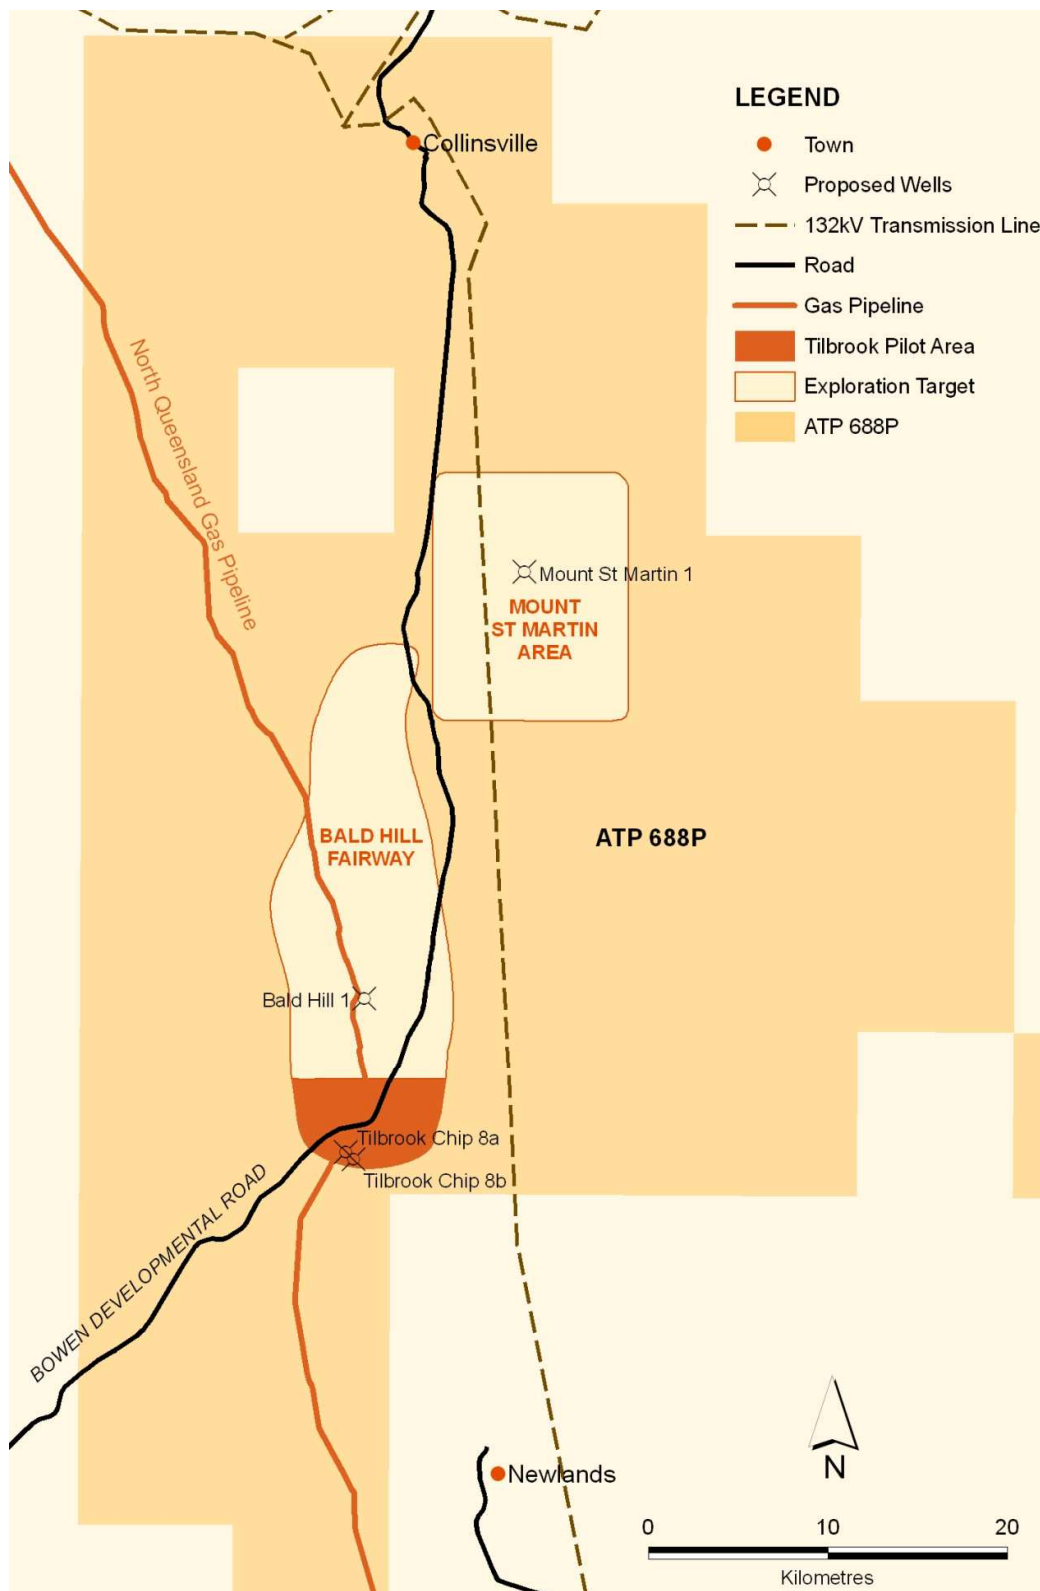

Additional information is available on WestSide’s website: www.westsidecorporation.com.
